

PARAGON MICROFIBRE FLAT MOPPING SYSTEM

This system enables floors and walls to be effectively cleaned and maintained with minimum effort. No wringer, trolley or buckets of water are required, just a mop handle and base and the necessary number of mop heads. The mop heads are washable

Damp Mop:

Is used damp to remove heavier soilings from all hard flooring surfaces. Damp mopping needs only to be carried out where dry mopping has failed to remove the soilings. The micro fibres work through capillary action, drawing dirt into the mop. Once the mop is dirty, place in laundry bag and continue cleaning with a clean mop.

For removing heavier soilings such as scuff marks, apply a little more water/detergent and apply pressure to the mop by placing your foot on the aluminium base. This ensures the micro fibre has maximum contact.
