

PARAGON MICROFIBRE FLAT MOPPING SYSTEM

This system enables floors and walls to be effectively cleaned and maintained with minimum effort. No wringer, trolley or buckets of water are required, just a mop handle and base and the necessary number of mop heads. The mop heads are washable

Dry Mop:

Is used dry for removing dust and loose particles from all hard floors and wall surfaces. Most floor surfaces should be dry mopped first as this will reduce the amount of damp mopping required later. If the floor surface is already wet or damp do not dry mop. As it is wiped over the surface it creates a static charge that attracts dirt to the mop, the micro fibre then 'holds' the dirt until the mop is washed.

The dry mop should be used on floors in a figure of 8, ensuring that larger, loose particles are trapped against the face of the mop. Once the dry mop becomes fully soiled it should be placed in the laundry bag and a clean, dry mop should be used to continue cleaning.
